

Nutrimol Nutritional Supplement for Alpacas

Nutrimol is a seaweed based general mineral supplement. Over 60 trace elements are present in Nutrimol's pure, highly concentrated liquefied seaweed base. This is fortified with chelated magnesium, copper and zinc. Molasses has been added to give Nutrimol greater palatability and provide an immediate energy source for the rumen micro-organisms.

Nutrimol has been in use in Australia and New Zealand for over 20 years now and has been tested under various conditions on all kinds of livestock.

Nutrimol is a very complex, concentrated seaweed based mineral supplement, therefore it can cost more per unit volume than some other products but it provides responses in animals that others do not. Importantly, Nutrimol has a natural base in the seaweed extract and the balance that this provides is important.

DIRECTIONS FOR USE :

NUTRIMOL Nutritional Supplement is a liquid preparation suitable for use when it is desired to increase the mineral intake of livestock, in particular Copper, Zinc and Magnesium.

GENERAL; Mix 1L Nutrimol with every 15,000L of drinking water, continual use.

For general use, where daily rates are not practical, administer fortnightly to improve animal health and monthly to maintain animal condition. For more specific uses, administer Nutrimol to young animals during periods of rapid growth and/or physical stress. Likewise, with older stock, use Nutrimol at important reproductive or production stages of the year and for times of physical stress when adequate mineral intake is vital. Nutrimol can be drenched, added to drinking water (trough systems) or poured over feed. Introduce Nutrimol to stock gradually.

With addition to water trough, leave water source turned on so that the Nutrimol dilutes with time. Add more Nutrimol when the required time interval has passed.

Shake well before use.

ALPACAS & LAMAS	
General	2 mL per animal per day over feed or in water
Pre-Joining	20 mL per animal 3-4 weeks pre-joining, over feed or in water
Pre-Birthing	20 mL per animal 3-4 weeks pre-birthing, over feed or in water
Pre-Clipping	20 mL per animal 3-4 weeks pre-clipping, over feed or in water
